

ABSTRACT

In an image-recording device using a disk-type recording medium generated under the DVD + RW standard, a
5 disk information-acquisition unit 250 acquires information about a disk 49, a disk-determination unit 260 determines that the disk 49 is a subject disk that is of a DVD + RW type and that stores video data generated by using a DVD menu and/or still-image data recorded onto the disk, an
10 additional recording-control unit 220 controls additional recording performed for the disk 49 according to a result of the determination performed by the disk-determination unit 260, and a message display-control unit 270 makes a display unit 280 show a confirmation message used for shifting to a
15 mode relating to the pros and cons of performing the additional recording and/or a message adapted to confirm that the DVD menu and the video data are updated, so that a mismatch which may occur between the DVD menu and/or the video data, and recorded image data is reduced.
